

SiteNET

SiteNET, from CityLink, offers a network neutral Internet data center (IDC) with secure co-location space for your web and data servers. SiteNET provides great flexibility without compromising the features you would expect in an IDC.

SiteNET Features and Benefits

- **Security and Accessibility** are not compromised. All locations have card-controlled access, monitored alarms and video surveillance which are digitally recorded. Security notwithstanding, SiteNET IDCs are freely accessible to you 24x7 so you can carry out your critical operations.
- **Uninterruptible Power and Climate Control** is fundamental for co-location. SiteNET locations have redundant cooling systems and options for UPS and generator back-up (location dependant).
- **Connectivity** is unparalleled for all SiteNET locations because of their accessibility to the New Zealand domestic peering exchanges.
- **Flexible Housing Options** are available ranging from full racks to shared community space (location dependant).
- **Neutral Bandwidth**, which gives you flexibility and control, is available at all SiteNET IDCs. Because all these locations are carrier neutral you have the freedom to choose the bandwidth solutions that best meet your requirements.

SiteNET offers reliability and performance, which are essential when delivering corporate or internet applications and services. SiteNET locations have been developed with your need for up-time in mind.

Detailed Features:
